LEVI KING

Type: ROUTINE INSPECTION
Date: 07-JAN-2020

3.25(a) **REPEAT**

FACILITIES, GENERAL.

During the inspection, three guinea pigs were observed to be out of their enclosure and running around on the floor of the building. The side walls of the enclosures measured approximately 7 inches in height but in some areas where the bedding and hay was compacted, the side walls measured approximately 6.25 inches in height. Guinea pigs that have escaped their enclosure could be at risk of injury or escape from the barn as well as the inability to access food and water.

The enclosure must contain the animals. The licensee must ensure that the enclosure contains the animals at all times and does not allow them to escape.

3.25(c) **REPEAT**

FACILITIES, GENERAL.

A partial bag of shavings was observed to be open and on the floor and huddled next to the bag was a rabbit. Also on the floor was a bale of grass hay that was used as feed for the guinea pigs. Rabbits that were loose in the building were moving freely around the bag of shavings and the loose bale of hay.

Feed and bedding need to be stored in facilities which protect them from contamination. Contaminated bedding and feed can lead to the spread of disease in the animals as well as potential respiratory issues. Correct by keeping the feed and bedding stored in such a manner as to prevent contamination.

3.26(a) **DIRECT**

FACILITIES, INDOOR.

The temperature inside the guinea pig housing building as measured with a kestrel was 51.2 degrees F. Although there was a wall heater, there were several windows open and the garage door at the front of the building was also

Title: FACILITY REPRESENTATIVE

Date: 07-JAN-2020

open.
Guinea pigs kept in ambient temperatures that are too low may be subject to cold stress that may predispose them to developing other health issues.
The ambient temperature in indoor housing facilities for guinea pigs must not fall below 60 degrees F.
Correct by: January 8, 2019

3.29(d) DIRECT REPEAT

FEEDING.

Feeders in several of the guinea pig enclosures had fecal pellets contained within the feeders and mixed in the feed.

Feeders and food receptacles need to be clean and free of fecal material. Failure to do so can lead to disease or can lead to the avoidance of feeding, both of which can have negative impacts on animal health. Correct by keeping the feeders clean and sanitizing at a minimum of once every two weeks.

3.30

WATERING.

Several of the guinea pig enclosures had water spigots that were found to be surrounded with a mixture of hair and wet, greenish/brown material.

All watering receptacles shall be sanitized when dirty and at a minimum of once every two weeks. Failure to do so can lead to an increase in disease or avoidance of the water, both of which can have negative impacts on animal health. Correct by cleaning the water spigots as needed and sanitizing at least one every two weeks. Correct by January 17, 2020.

3.31(a)(1) REPEAT

SANITATION.

The guinea pig pens contained a large amount of soiled, wet bedding especially in the areas of the automatic waterers. In addition, there was a large amount of fecal material and discarded food and hay mixed with the bedding and the pens were in need of more frequent cleaning. There was also a large piece of blue bailing twine covering an area approximately 5 inches by 5 inches in size in one of the guinea pig pens.
The accumulation of feces and unclean enclosures can cause unpleasant odors, lead to contamination of the enclosure, and attract pests and vermin that carry diseases that result in risks to the health of the animals.

Prepared By:

RADZAI CHRISTINA, D V M USDA, APHIS, Animal Care

Date: 07-JAN-2020

Title: VETERINARY MEDICAL OFFICER 6138

Received By:

NAOMI KING

Date: 07-JAN-2020

Title: FACILITY REPRESENTATIVE

Primary enclosures must be cleaned and sanitized as often as necessary to prevent the accumulation of excreta or debris.

3.31(b)

SANITATION.

There was a large amount of discarded bedding, hay, and debris on the floor under and around the guinea pig pens. There were at least 3 loose rabbits in the building housing the guinea pigs which were observed running around and defecating on the floor. There was debris and dirt coating the windowsills. There were numerous spiderwebs hanging from the ceiling over the open guinea pig pens.
The lack of sanitation and presence of dust and debris and rabbit fecal matter may attract pests into the room, result in unpleasant odors, and may contribute to spread of disease.
Housing buildings must be kept clean and in good repair to protect the animals from injury and to facilitate prescribed husbandry practices.
Correct by: January 14, 2020

This inspection and exit interview were conducted with the facility representative.

LEVI KING

Type: ROUTINE INSPECTION
Date: 12-FEB-2020

3.26(a) DIRECT REPEAT

FACILITIES, INDOOR.

The temperature inside the guinea pig housing building as measured with a kestrel was 56.8 degrees F. Although there was a wall heater, there were several windows open.
Guinea pigs kept in ambient temperatures that are too low may be subject to cold stress that may predispose them to developing other health issues.
The ambient temperature in indoor housing facilities for guinea pigs must not fall below 60 degrees F.

3.29(d) DIRECT REPEAT

FEEDING.

Approximately 50% of the self-feeders had fecal pellets contained within the feeders and mixed in the feed. The fecal material appeared dry and not fresh and there were a few feeders with only fecal material present in the feeder.
Feeders and food receptacles need to be clean and free of fecal material. Failure to do so can lead to disease or can lead to the avoidance of feeding, both of which can have negative impacts on animal health. Correct by keeping the feeders clean and sanitizing at a minimum of once every two weeks.

3.31(a)(1) REPEAT

SANITATION.

Approximately 75% of the guinea pig enclosures contained a large amount of soiled wet bedding with an accumulation of excess fecal material, debris, and discarded feed mixed in with the bedding and the pens were in need of more frequent cleaning. The facility reported the majority of pens had last been cleaned 6 days ago.
The accumulation of feces and unclean enclosures can cause unpleasant odors, lead to contamination of the enclosure, and attract pests and vermin that carry diseases that result in risks to the health of the animals.
Primary enclosures must be cleaned and sanitized as often as necessary to prevent the accumulation of excreta or debris.

Date: 19-OCT-2020

3.25(a) **Repeat**

Facilities, general.

Although the side walls of the enclosures measured approximately 7 inches in height, during the inspection, one guinea pig was observed to be out of the enclosure and running around on the floor of the building.

Guinea pigs that have escaped their enclosure could be at risk of injury or escape from the barn as well as the inability to access food and water.

The enclosure must contain the animals. The licensee must ensure that the enclosure contains the animals at all times and does not allow them to escape.

3.31(b)

Sanitation.

There was a large amount of discarded bedding, hay, and debris on the floor under and around the guinea pig pens.

The lack of sanitation and presence of debris may attract pests into the room, result in unpleasant odors, and may contribute to spread of disease.

The buildings used for housing animals must be kept clean and in good repair to protect the animals from injury and to facilitate prescribed husbandry practices and maintain the health of the animals.

Type: ROUTINE INSPECTION
Date: 10-MAR-2020

2.40(b)(2)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There were 2 guinea pigs observed with health conditions requiring treatment in accordance with the Program of Veterinary Care or consultation with the attending veterinarian. In Pen 6 there were 3 adult guinea pigs (2 black and white and 1 brown and white) with head tilts. The animals were eating and drinking normally and appeared to be in good body condition. The facility had observed these animals had head tilts approximately one month prior to the inspection but had not contacted the attending veterinarian and had not applied the treatments described for animals with head tilts in the Program of Veterinary Care. The attending veterinarian was contacted and agreed these animals should be treated.
Head tilts can be due to various causes and delays in providing appropriate veterinary care for these conditions can result in worsening of the condition and potentially spread to other unaffected animals if infectious in nature.
The licensee must initiate treatment as described in the Program of Veterinary Care or consult with the attending veterinarian regarding the head tilts in these 3 guinea pigs.
Correct by: March 13, 2020

3.30

WATERING.

There was a buildup of bedding, debris, and wet greenish material around the nipples of the automatic waterers. There were stainless steel water bowls being used to administer treated water in 7 pens in addition to the automatic waterers. The bowls were empty at the time of inspection but contained a buildup of bedding and debris at the bottom of the bowls.
Failure to clean and sanitize water receptacles often enough to prevent accumulation of debris can result in decreased water intake or spread of disease which can negatively impact the health of the animals.
Watering receptacles must be kept clean and sanitized as necessary to maintain the health and well-being of the animals.

Date: 12-FEB-2020

2.40(b)(2) DIRECT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There was 1 guinea pig observed with a health condition requiring treatment in accordance with the Program of Veterinary Care or consultation with the attending veterinarian.
In pen 11, there was a brown and white newborn guinea pig housed with 13 other guinea pigs. The newborn was lethargic and minimally responsive with sunken eyes that were held partially closed. The animal was observed to be sitting in one position and not moving and exhibited limited reaction when approached by other guinea pigs in the pen. In addition, the animal appeared to be breathing with increased respiratory rate and effort.
The licensee had not observed any problems with this animal, had not contacted the attending veterinarian, and was not administering any treatments.
Newborns that are lethargic and depressed with respiratory issues can rapidly worsen if not evaluated and treated. Failure to identify and treat health conditions can lead to worsening of the condition including death.
The licensee must communicate with the attending veterinarian to evaluate these animals and determine an appropriate plan for diagnosis and treatment.
Correct by: February 13, 2020
Note: The licensee called the attending veterinarian during the inspection.

This inspection and exit interview were conducted with the licensee.

Type: ROUTINE INSPECTION
Date: 13-OCT-2020

3.28(a)(1) **Repeat**

Primary enclosures.

The second enclosure from the bottom on the 5th rack on the left side of the building has a hole approximately 2 inches wide by 5 inches in length on the side wall. There is protruding wire with sharp points where the wire is broken. This enclosure is housing 11 adult guinea pigs and their offspring. Holes and protruding wire with sharp points can cause injury to the guinea pigs.

Enclosures housing guinea pigs must be structurally sound and maintained in good repair to protect the guinea pigs from injury. The above enclosure must be repaired or replaced to prevent injury to guinea pigs.

3.29(d) **Repeat**

Feeding.

There are three enclosures on the 1st rack on the left side of the building with severely rusted self-feeders. The second enclosure from the bottom also has jagged and sharp edges. Rusty feeders and jagged edges can no longer be appropriately cleaned and sanitized, and may injure guinea pig attempting to feed. Food receptacles must be kept clean and sanitized at least once every 2 weeks. The above self-feeders must be repaired or replaced.

3.31(b)

Sanitation.

Prepared By: ROBERT MARKMANN

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

There was one guinea pig observed with a health condition requiring treatment in accordance with the Program of Veterinary Care or consultation with the attending veterinarian. A brown and white adult guinea pig in pen 2 had a firm movable mass approximately 2 inches in size under its chin. The facility had not observed the condition, had not contacted the attending veterinarian, and had not administered any treatments. The attending veterinarian was contacted and was not comfortable with the fact that the facility did not consult with her regarding this animal's condition and was not treating it according to the program of veterinary care.
Swellings in the neck can be indications of disease or injury, can be painful, affect the overall health and well-being of the animal, and may require treatment with antibiotics or other medications. Failure to seek proper diagnosis and treatment for disease may result in pain to the animals, worsening of the condition, and possible spread to additional animals if the condition is contagious.
The facility must contact the attending veterinarian to have the animal evaluated in order to determine an appropriate plan for diagnosis and treatment.
Correct by: February 14, 2020

2.75(b)(1)(iv)

RECORDS: DEALERS AND EXHIBITORS.

The facility's disposition records are incomplete. The sales slips do not include the name and address of the dealer or person to whom the guinea pigs are being sold.
Failure to maintain sales records that include names and addresses of the buyer can make it difficult to track animals for trace back and trace forward and to document changes in ownership.
The facility must maintain sales records that include the full name and address of the buyer.
Correct by: February 19, 2020

Prepared By:

RADZAI CHRISTINA, D V M USDA, APHIS, Animal Care

Date: 11-FEB-2020

Title: VETERINARY MEDICAL OFFICER 6138

Received By:

BARBIE BEILER

Title: FACILITY REPRESENTATIVE

Date: 12-FEB-2020

3.26(b) DIRECT

FACILITIES, INDOOR.

There was a strong ammonia odor throughout the indoor guinea pig housing building causing the inspector's eyes and nose to burn. This was a result of soiled enclosures in need of more frequent cleaning and although some roof vents were open it was not enough to allow proper ventilation of the room.
Failure to provide fresh air can cause respiratory distress and expose the guinea pigs to potential disease hazards.
The indoor housing facilities must be ventilated to minimize odors and ensure the health of the animals.
Correct from this day forward

3.28(a)(1)

PRIMARY ENCLOSURES.

There were metal wires attached to the side of the self-feeders with exposed sharp wire tips that were present at eye level of the guinea pigs in Pens 11 through 16 and Pens 20 through 34. In addition, the area around the waterers in approximately 90% of the enclosures was chewed resulting in exposed unsealed wood.
Wire tips at eye level of the guinea pigs may result in injury to the animals. Chewed, exposed wood is not impervious to moisture and can increase the spread of disease through improper sanitation.
Primary enclosures shall be structurally sound and maintained in good repair to protect the guinea pigs from injury and constructed of material that is substantially impervious to moisture that can be easily cleaned and sanitized.
Correct by: March 11, 2020

3.29(d) DIRECT

FEEDING.

Approximately 75% of the self-feeders attached to the inside of the guinea pig enclosures contained fecal material and bedding material mixed in with the feed. The fecal material appeared dry and not fresh and the feed had deteriorated to a ground up powder in the trough of many feeders such that there was little to no pelleted feed available in the trough.
Failure to clean feeders often enough to prevent contamination with fecal material can result in avoidance of food or spread of disease.
Food receptacles must be located to minimize contamination by excreta and must be kept clean. If self-feeders are used for the feeding of pelleted feed, measures must be taken to prevent deterioration or caking of the feed.
Correct from this day forward

Prepared By:

RADZAI CHRISTINA, D V M USDA, APHIS, Animal Care

Date: 11-FEB-2020

Title: VETERINARY MEDICAL OFFICER 6138

Received By:

BARBIE BEILER

Date: 12-FEB-2020

Title: FACILITY REPRESENTATIVE

3.30

WATERING.

There was a buildup of bedding, feed, debris, and wet greenish material around the nipples of the automatic waterers in the floor pens (Pens 1 through 34). There were 6 water bottles attached to the rack of weanling pens with an accumulation of green material coating the inside of the water bottle.
Failure to clean and sanitize waterers often enough to prevent accumulation of debris can result in decreased water intake or spread of disease which can negatively impact the health of the animals.
Watering receptacles must be kept clean and sanitized as necessary to maintain the health and well-being of the animals.
Correct by: February 19, 2020

3.31(a)(1)

SANITATION.

Almost all of the guinea pig enclosures contained a large amount of soiled wet bedding with an accumulation of excess fecal material, debris, and discarded feed mixed in with the bedding and the pens were in need of more frequent cleaning. The racks of pens with weanlings had a buildup of dirt, debris, and bedding embedded in the wire mesh on the sides of the enclosures. The facility reported that the enclosures had last been cleaned approximately 6 days ago.
The accumulation of feces and unclean enclosures can cause unpleasant odors, lead to contamination of the enclosure, and attract pests and vermin that carry diseases that result in risks to the health of the animals.
Enclosures must be cleaned and sanitized as often as necessary to prevent a build-up of debris and fecal material and sanitized at a minimum of once every two weeks.
Correct by: February 19, 2020

3.31(b)

SANITATION.

There was an accumulation of bedding and debris attached to the walls of the room above the rear of the floor pens. There was a large amount of spiderwebs mixed with bedding in the corners of the room above two of the floor pens and above one of the racks of weanling pens. There was dirt and spiderwebs coating the overhead fans.
The lack of sanitation and presence of dust and debris may attract pests into the room, result in unpleasant odors, and may contribute to spread of disease.
The buildings used for housing animals must be kept clean and in good repair to protect the animals from injury and to facilitate prescribed husbandry practices and maintain the health of the animals.

Date: 18-FEB-2020

3.25(a)

FACILITIES, GENERAL.

There were 3 adult loose guinea pigs observed that had escaped from enclosures and were free on the floor of the facility. Housing facilities need to protect the animals from injury and contain the animals. Failure to do so can lead to injury or death from falls to the ground, escape from the animal room, or become trapped outside the enclosure. The facility must be structurally sound and and must be maintained in good repair, to protect the animals from injury, to contain the animals, and to restrict the entrance of other animals. Correct by February 25, 2020.

3.31(b)

SANITATION.

Housekeeping. There is a buildup of dust, dirt, debris, spilled seed, guinea pigs droppings, clutter, tools, boxes, bags, and parts of old pens on the floor of the animal room. Animal facilities must be kept clean to ensure good quality of air for the animals and to prevent unnecessary disease risks. Ineffective cleaning and housekeeping exposes the animals to disease hazards, pests problems, and health problems. Correct by ensuring the premises are kept clean, including: removing dust, dirt, debris, spilled seed, droppings, clutter, boxes, bags, old cages, and tools from the floor of the animal room, cleaning the floor; and maintaining a level of general cleanliness to support good animal husbandry and health. Correct by February 29, 2020.

This inspection and exit interview were conducted with the owner.

Type: ROUTINE INSPECTION
Date: 29-JAN-2020

3.25(c)

FACILITIES, GENERAL.

On today's inspection, the hay for being fed to the guinea pigs was observed stored directly on the floor.
Feed/food that is stored inappropriately can result in deterioration of the food or be contaminated by pests, mold, or other sources and if used, cause illness in the animals.
Supplies of food and bedding must be stored in facilities which adequately protect such supplies against spoilage or deterioration and infestation or contamination by vermin.
Correct by: February 5, 2020

3.26(b) DIRECT REPEAT

FACILITIES, INDOOR.

Upon entering the building housing the guinea pigs, there was a strong ammonia odor causing the inspector's eyes and nose to burn. This was a result of soiled enclosures in need of more frequent cleaning and the vents being kept only partially opened. When the facility representative opened the vents further and opened the door the odor dissipated.
Failure to provide fresh air can expose the guinea pigs to potential disease hazards.
The indoor housing facilities must be ventilated to minimize odors and ensure the health of the animals.

Remains uncorrected.

3.28(a)(1)

PRIMARY ENCLOSURES.

In several of the guinea pig pens, the wooden sides of the enclosure are chewed, worn down, and have exposed unsealed wood. There are also several pens that have chewed and exposed wood around the opening for the

Prepared By:

RADZAI CHRISTINA, D V M USDA, APHIS, Animal Care

LIZZIE FISHER

Title: FACILITY REPRESENTATIVE

Date: 29-JAN-2020

automatic watering system. Additionally, all of the pens have a thin piece of wood attached to the tops of the walls to increase wall height. This wood is not sealed or painted and therefore is not impervious to moisture.
Chewed, exposed wood or unsealed wood that is not impervious to moisture can be difficult to clean and sanitize and can increase the spread of disease through improper sanitation.
Enclosures for guinea pigs must be kept structurally sound, maintained so that they are impervious to moisture, can be readily cleaned and sanitized, and won't absorb moisture or odors.
Correct by: February 19, 2020

3.31(a)(1) **REPEAT**

SANITATION.

Many enclosures in this facility require additional cleaning. Approximately half of the enclosures have an accumulation of dirt and debris especially in the corners and excessive build-up of fecal material.
The accumulation of feces and unclean enclosures can cause unpleasant odors, lead to contamination of the enclosure, and attract pests and vermin that carry diseases that result in risks to the health of the animals.
The licensee must thoroughly clean all primary enclosures often enough to prevent an accumulation of excreta and debris.

Remains uncorrected.

This inspection and exit interview were conducted with the facility representative.

Date: 07-JAN-2020

3.28(a)(1)

PRIMARY ENCLOSURES.

The back wall is rusty on the two upper enclosures housing 25 and 15 guinea pigs each. Primary enclosures must be constructed of smooth material that is substantially impervious to liquids and moisture. Enclosures with rusty surfaces that are no longer impervious to moisture can prevent proper cleaning and sanitation. Inadequate cleaning and sanitation can result in disease risks to the guinea pigs. These two enclosures must be resealed, repaired, or replaced s that wall surfaces are impervious to liquids and moisture. Correct by February 15, 2020.

This inspection and exit interview were conducted with the owner.

2.75(b)(1)

RECORDS: DEALERS AND EXHIBITORS.

There were no records of the current number of guinea pigs on hand at the facility. Records containing the required information for animals which fully and correctly disclose the number of guinea pigs held, owned, acquired, and disposed of are necessary in order to accurately track animals being used in regulated activities to ensure their humane care and use. Failure to maintain these records can make it difficult to identify animal losses through death or disease in the facility that affects the number of offspring born and raised. Correct by March 11, 2020.

This inspection and exit interview were conducted with the manager.

3.31(b)

SANITATION.

Housekeeping. There is a build-up of loose hay, dirt, dust, rodent droppings, cobwebs, and debris on the floor and walls of the room housing the guinea pigs. Cardboard boxes, empty bags, and lumber are being stored on the floor of the animal room, food storage room, and in the rear room of the facility. Animal facilities must be kept clean to ensure good quality of air for the animals and to prevent unnecessary disease risks. Ineffective cleaning and housekeeping exposes the animals to disease hazards, pests problems, and health problems. Correct by ensuring the premises are kept clean, including: removing accumulations of loose hay, dust, rodent droppings, boxes, bags, and lumber from the animal room, food storage room, and storage areas; cleaning the floor and walls; and maintaining a level of general cleanliness to support good animal husbandry and health. Correct by February 10, 2020.

3.31(c)

SANITATION.

Pest Control. There are numerous rodent droppings on the floor of the room housing guinea pigs. The floor of the animal room contains loose, hay, dirt, dust, debris, cardboard boxes, bags, and lumber. There were no pest control devices present in the animal room, food storage room, or the rear storage room. Lack of a pest control program can expose the guinea pigs to disease hazards and health problems. Licensee must establish and maintain and effective program for the control of mammalian pests such as mice to protect the health of the guinea pigs. Correct by February 10, 2020.

This inspection and exit interview were conducted with the owner.

3.28(c)(1)(iii) **Repeat**

Primary enclosures.

Space. Insufficient space was being provided in 13 enclosures housing 15 guinea pig weanlings in each enclosure. Enclosures measure 30 inches by 28.5 inches or 855 square inches. The food bowl (6.25 inches in diameter) took up an additional 30.66 square inches of floor space leaving a total of 824.34 square inches. Weanlings up to 350 grams require at least 60 square inches of floor space each.

Inadequate space can cause stress, crowding, and aggression in animals. Licensee must ensure that guinea pigs are provided with at least the minimum space requirements to prevent stress, crowding, and discomfort to the animals. Can not house more than 13 guinea pig weanlings in the current enclosures.

This inspection and exit interview were conducted with the licensee.

Type: ROUTINE INSPECTION
Date: 03-MAR-2020

3.31(a)(1)

SANITATION.

There are accumulations of soiled bedding and excreta covering the floors of the enclosures housing guinea pigs with fresh hay on top. Primary enclosures for guinea pigs must be cleaned and sanitized often enough to prevent accumulations of soiled bedding and excreta. The cleaning process (method and frequency) is not often enough to prevent this accumulation. Ineffective cleaning and sanitation exposes the guinea pigs to potential diseases hazards such as bacteria, fungal, and viral diseases. Correct by ensuing that all primary enclosures are kept clean to prevent an accumulation of soiled bedding and excreta and that enclosures are sanitized at least once every 2 weeks. Correct by March 4, 2020.

This inspection and exit interview were conducted with the owner's mother.
