AMOS AND KATIE STOLTZFUS

Type: ROUTINE INSPECTION
Date: 13-OCT-2020

2.40(b)(2) Direct

Attending veterinarian and adequate veterinary care (dealers and exhibitors).

There were 3 guinea pigs observed with health conditions requiring treatment in accordance with the Program of Veterinary Care or consultation with the attending veterinarian. There were 2 guinea pigs with respiratory conditions the licensee had not observed and was not treating. In Pen B, a tri-color adult guinea pig was observed with increased respiratory effort and large chest movements when breathing. This animal was also heard with a raspy breathing noise and was lethargic. In Pen A, a brown and white adult was observed with increased respiratory effort and large chest movements when breathing. This animal was also lethargic. There was one guinea pig with signs of lameness. In Pen D, a black and white adult guinea pig was observed to be reluctant to bear weight on the front legs. When examined closer, both foot pads on the front feet were moderately swollen and red and had dirt and debris stuck on them. The licensee had not observed the health problems in these animals, had not contacted the attending veterinarian, or applied any treatments. Respiratory conditions and swollen feet can be painful, can worsen and spread to other parts of the body and result in other health issues. Delays in providing appropriate veterinary care for these conditions can result in worsening of the condition and potentially spread to other unaffected animals if infectious in nature. The licensee must communicate with the attending veterinarian to evaluate these animals and determine an appropriate plan for diagnosis

3.31(a)(1)

Sanitation.

The majority of the guinea pig enclosures had an accumulation of excess fecal material, dirt, and debris with little or no clean bedding available. The licensee said the pens had last been cleaned 3 days ago but no clean bedding is being added between cleanings.

The accumulation of feces and unclean enclosures can cause unpleasant odors, lead to contamination of the enclosure, and attract pests and vermin that carry diseases that result in risks to the health of the animals.

Enclosures must be cleaned and sanitized as often as necessary to prevent a build-up of debris and fecal material and sanitized at a minimum of once every two weeks.

3.30

Repeat

Watering.

The PVC piping used as drip pans for the water bottles contained an accumulation of fecal material, dirt, and debris, both on the drip pans and around the surface of the pipes and was in need of more frequent cleaning. The licensee is spot cleaning the drip pans daily but is only cleaning the outside of the pipes on an occasional basis.

Failure to clean and sanitize waterers often enough to prevent accumulation of debris can result in decreased water intake or spread of disease which can negatively impact the health of the animals.

Watering receptacles must be kept clean and sanitized as necessary to maintain the health and well-being of the animals.

Inspection Report

The facility's disposition records are incomplete. The sales slips do not include the address of the dealer or person to whom the guinea pigs are being sold.

Failure to maintain sales records that include complete information for the buyer can make it difficult to track animals for trace back and trace forward and to document changes in ownership.

The facility must maintain sales records that include the address of the buyer.
